Attention-Deficit/Hyperactivity Disorder (ADHD) in Children and Adolescents

Definition

Attention-deficit/hyperactivity disorder (ADHD) is characterized by *developmentally inappropriate* levels of:

- ✎ Inattention (trouble focusing, getting distracted, trouble paying attention, making careless mistakes, losing things, trouble following through on things, poor organization, doesn't seem to be listening)
- ✎ Impulsivity (acting without thinking, interrupting, intruding, talking excessively, difficulty waiting for turns)
- ✎ Hyperactivity (trouble sitting still, fidgeting, feeling restless, difficulty engaging in quiet activities)

ADHD is a neurobiological disorder that affects three to seven percent of school-age children. Until relatively recently, it was believed that children outgrew ADHD in adolescence as hyperactivity often lessens during the teen years. However, it is now known that ADHD nearly always persists from childhood through adolescence and that many symptoms continue into adulthood. In fact, current research reflects rates of roughly two to four percent among adults.

There are three types of ADHD:

- ✎ ADHD Combined Type (Classic ADHD) - trouble with inattention, hyperactivity and impulsivity
- ✎ ADHD Predominately Inattentive Type - trouble with attention, sluggish; most common type, often picked up later than the other types
- ✎ ADHD Predominately Hyperactive Impulsive Type - trouble with impulsivity and hyperactivity; occurs more often in younger children

Why do we care?

Although individuals with this disorder can be very successful in life, without proper identification and treatment, ADHD may have serious consequences, including school failure, family stress and disruption, depression, problems with relationships, substance abuse, delinquency, risk for accidental injuries and job

failure. Additionally, at least two thirds of individuals with ADHD have another co-existing condition, such as learning problems, anxiety or behavior problems. Early identification and treatment are extremely important.

What can we do about it?

Take your child or adolescent for an evaluation if ADHD is suspected. There are several types of professionals who can diagnose ADHD, including school psychologists, clinical psychologists, clinical social workers, nurse practitioners, neurologists, psychiatrists and pediatricians.

Once diagnosed, ADHD in children often requires a "multimodal" comprehensive approach to treatment which includes:

- ✎ Parent and child education about diagnosis and treatment
- ✎ Behavior management techniques
- ✎ Medication
- ✎ School programming and supports

Specific strategies to use at home include:

- ✎ Setting up a daily school/home note system with your child's teachers
- ✎ Being consistent
- ✎ Having set rules and consequences
- ✎ Using praise and rewards frequently
- ✎ Setting up a reward system at home
- ✎ Identifying a homework buddy or tutor to help with homework
- ✎ Learning as much as you can about ADHD so you can be a strong advocate .
 - Taking a course on ADHD taught by a parent with a child with ADHD can be very helpful. To find one near you, go to <http://www.chadd.org/parent2parent/index.htm>
- ✎ Identifying a mental health professional who can help you to set up a behavioral management program

Facts for Families

Attention-Deficit/Hyperactivity Disorder (ADHD) in Children and Adolescents Continued

-  Asking your therapist to improve social relationships by:
- Systematic teaching of social skills in a social skills group
 - Teaching social problem solving
 - Teaching other behavioral skills often considered important by children, such as sports skills and board game rules
 - Decreasing undesirable and antisocial behaviors
 - Helping your child in developing a close friendship
